Microfiber cloths may do more harm than good.

While microfiber cloths may contribute to reducing bacteria on contaminated surfaces, they **can also spread that bacteria to other surfaces** during subsequent cleaning.¹

Studies have shown that microfiber cloths can **lose their decontamination efficacy quickly** due to reprocessing/relaunders.²

Some kinds of microfiber cloths **can greatly reduce the effectiveness of Quat-based disinfectants due to a phenomenon known as Quat binding**. Instead of being applied to the surface targeted for cleaning, the Quat solution instead attaches itself to the cloth, resulting in concentrations too weak to effectively disinfect surfaces.³

PDI's Ready To Use (RTU) products eliminate the need for dilution of disinfectant and the need for routine bucket maintenance.
