

Putting AORN Preoperative Skin Antisepsis Guideline into Practice

Defend with Profend® Nasal Antiseptic Kit

The recently released, May 2021, AORN guideline for preoperative skin antisepsis describes the importance of nasal and skin decolonization for the reduction of surgical site infections. The guideline navigates risk-based decisions for developing preoperative decolonization programs. This document highlights how **Profend** Nasal Antiseptic Kit fits nicely within the various components, by referencing AORN guideline section numbers (1.2.1, 1.3.2, etc.), of a supportive decolonization program.

Program Development

Upon the facility team's decision to implement a decolonization program, AORN recommends focus on the following areas: strategy, timing, protocol, and education.

Decolonization Strategies (1.2.1)

- **Universal:** Universal decolonization is a horizontal approach to reduce clinically relevant pathogens through use of interventions for all members of a population regardless of their colonization status.
 - **Profend** antiseptic swabs have broad-spectrum activity against *S. aureus* and other bacteria.¹
 - By using **Profend** antiseptic swabs universally, the need to screen pre-operatively may be eliminated, thereby saving on laboratory tests, costs, and time.
 - No evidence of bacterial resistance has been seen with PVP-I.²
- **Targeted:** Targeted decolonization is a vertical approach to reduce a specific pathogen for a select population (e.g., *S. aureus*).
 - **Profend** antiseptic swabs reduce 99.7% of *S. aureus* at 10 minutes and 99.9% at 12 hours for patients testing (+) for nasal colonization of *S. aureus*.³
- **Blended:** Blended decolonization is using both approaches; e.g., decolonizing all orthopedic surgery patients (universal) but screening cardiac surgery patients and treating only those colonized with *S. aureus* (targeted).
 - **Profend** antiseptic swabs provide flexible benefits to support blended approach.

Urgent Procedures (1.3.2)

A *S. aureus* decolonization protocol may be established for patients undergoing urgent procedures; due to time constraints, patients undergoing urgent procedures often do not receive screening or begin a decolonization protocol.

- **Profend** antiseptic swabs can be used in emergent procedures by reducing 99.7% of *S. aureus* at 10 minutes.³

Implementation (1.4)

Implement the preoperative *S. aureus* decolonization program as defined by the interdisciplinary team. Establish timing for initiation and completion of the decolonization protocol. Identify resources needed, procurement of products, and education for both patients and healthcare workers on the benefits of the decolonization program.

• Timing (1.4.1)

- With **Profend** antiseptic swabs, no additional resources are needed for *S. aureus* lab screening tests.
- Treatment with **Profend** swabs does not require a prescription; may be utilized via standing physician order or nurse driven protocols.
- Application is simple, efficient, and easily fits within the pre-operative workflow.
 - Application is typically 1 hour pre-procedure; 10-minute pre-procedure for emergent cases.
 - Neat, dry-handle design minimizes mess.
 - Pre-saturated swabs need no preparation – just snap and swab.
 - Slim, compact design for patient comfort.
 - Assured treatment compliance as product is applied by clinician.
 - 96.6% of patients surveyed are comfortable with nasal application of PVP-I.⁴
- The 60 second total treatment time is up to 2.5x faster than other PVP-I nasal decolonization products application.⁵
 - 4 swabsticks/patient (2 each nostril); 15 sec. for each swabstick application.
- *In vivo* data shows a 99.9% reduction of *S. aureus* at 12 hours post application³ providing coverage during the high-risk operative period.

• Procurement (1.4.2)

- **Profend** Nasal Antiseptic Kit is readily available through your medical supply distributor.
- The neatly packaged kit consists of:
 - 4 swabsticks in 1 patient kit
 - 12 patient kits in 1 box (shelf unit)
 - 4 shelf units in a case
- Product packaging suitable for patient pre-op holding areas.

• Education (1.4.3 and 1.4.4)

- Patient pamphlets for the **Profend** Nasal Antiseptic Kit are available to educate patients on the nasal decolonization process and its benefits.
- Education is available for healthcare workers via:
 - Onsite or virtual vendor training
 - Online training modules
 - Video and written IFU
